As someone who is a coffee connoisseur, the Cafe dataset instantly caught my attention and I decided to start cleaning and analyzing this dataset. Some of the business questions that I hope to answer include the following:

- Which items generate the highest total revenue?
- Which items have the highest average order quantity?
- How does revenue differ between in-store vs takeaway?
- What are the top selling items by quantity and by revenue
- What is the distribution of payment methods (Cash, Credit Card, Digital Wallet)?
- Which payment method is associated with the highest average transaction value
- What are the daily, weekly, or monthly sales trends?
- Which days of the week or months have the highest/lowest sales?
- Are there seasonal patterns or peaks?
- Which items should be promoted more aggressively based on revenue vs volume?

This is a dataset that has 10,000 synthetic cafe transactions with the following columns: Transaction ID, Item, Quantity, Price Per Unit, Total Spent, Payment Method, Location (In-store/Takeaway) and Transaction Date

When cleaning the data, there were no duplicates, but a lot of blanks in which I put UNKNOWN. Other than that, there were not many other things that I did to clean the data.
